In the department of Electrical Engineering for HOD Cabin & Smart Board separate Offline 1 KW off grid Solar power system is installed. Three Solar plates of 350 Watt each are mounted on rooftop. Cable is connected to solar inverter and back up is taken from battery. This back up supports 5 , 20 Watt LED bulbs, 2 Ceiling fans, 2 PCs, 2 Laser Printers and one Laptop without any break.

Also supply is given to Smart board which is installed in Smart Classroom so that even in case of power failure uninterrupted teaching is in process. Solar system generates on an average 12-13 Units per day. In PV Mode Solar Voltage is 30.4 V , PV Current is 10.4 A. In UPS mode Battery Voltage is 30.4 V , Output Voltage is 217 V. In two years 2610.947 KWH energy is saved. Pay back period of this system is 4 years.

ENERGY CONSERVATION MEASURES :

- 1) “Switch Off Tube and Fans when not in use” such Instructions are displayed near switch boards.

- 2) Switching of Tubes which are located in corridor are controlled through a small circuit which is operated on the signal from motion sensor. In this circuit motion sensor detects presence of human being and switch on tube, as person disappears ie no motion is sensed by sensor supply of tube is disconnected.

- 3) **Lab Automation** : In computer Lab pair of Tube and Fan is controlled by one controller circuit. Lab is divided into four parts. If students or faculty is working in one part and there is no any student or faculty in other three parts then it's a wastage of electricity as all fans and tubes are ON. So sensor sense the motion of human being and switch on particular fan and tube & fan / tube from remaining sections are OFF. Also even if after completion of work student or faculty leave the lab without switching OFF fan and tube, these are automatically OFF after stipulated predefined period as there is no any motion.

- 4) **Remote Switching:** In this case a remote controlled Arduino circuit is incorporated in the circuit which controls the supply of Fan, Tube in the faculty cabin. Suppose faculty left his cabin when supply is cut off and he forget to switch off control switch, when supply is restore, Fan Tube will be switched ON. So in this case faculty can operate switches of Fan and Tube even from remote location through his mobile app and switch off the tube and fan.

Report on Computer Lab Automation through Motion Sensor Technology

Introduction: In an era where technological advancements are rapidly transforming our daily lives, integrating automation into various aspects of our surroundings becomes imperative. This report explores the implementation of computer lab automation through the utilization of motion sensor technology, specifically Passive Infrared (PIR) sensors, relays, and microcontrollers. The primary goal is to enhance energy efficiency by activating tube lights and fans based on detected motion within the lab.

Components Used:

1. Passive Infrared (PIR) Sensor:

- PIR sensors detect infrared radiation emitted by objects in their field of view. These sensors are employed to capture the heat signatures of moving objects, such as individuals entering the computer lab.

2. Relay:

- Relays serve as switching devices that control the power supply to the tube lights and fans. In this setup, relays act as intermediaries between the microcontroller and the electrical appliances, allowing for remote control.

3. Microcontroller:

- A microcontroller, the brain of the system, processes signals from the PIR sensor and triggers the corresponding relays. Arduino or Raspberry Pi are common choices for this purpose due to their versatility and ease of programming.

Working Principle: The PIR sensor continuously monitors the computer lab for any movement. When a presence is detected, the sensor sends a signal to the microcontroller. The microcontroller, programmed to respond to these signals, activates the relays connected to the tube lights and fans. As a result, the lights and fans are turned on, creating a conducive environment for users. After a predefined period of inactivity, the microcontroller instructs the relays to switch off the lights and fans, contributing to energy conservation.

Vision: "To Satisfy the aspirations of youth force, who want to lead the nation towards prosperity through techno-economic development"

Mission: "To provide, nurture and maintain an environment of high academic excellence, research and entrepreneurship For all aspiring Students, which will prepare them to face global challenges maintaining high ethical and moral Standards"

Advantages:

1. **Energy Efficiency:** The system ensures lights and fans are only operational when needed, reducing unnecessary energy consumption.
2. **Cost Savings:** By automating the control of electrical appliances, the institution can experience cost savings on electricity bills.
3. **User Comfort:** The automation provides a seamless and comfortable user experience by eliminating the need for manual control.

Challenges and Considerations:

1. **False Positives:** PIR sensors may occasionally trigger false positives due to factors like rapid temperature changes or the presence of small animals. Fine-tuning the sensitivity of the sensor can mitigate this issue.
2. **Maintenance:** Regular maintenance and monitoring are essential to address any technical glitches or component failures.
3. **Integration with Existing Systems:** Compatibility with existing infrastructure and systems within the computer lab should be ensured during the implementation phase.

Conclusion: The integration of motion sensor technology into computer lab environments offers a promising avenue for enhancing energy efficiency and user experience. By utilizing PIR sensors, relays, and microcontrollers, institutions can contribute to sustainable practices while providing a technologically advanced and user-friendly workspace. As technology continues to evolve, the automation of such spaces will likely become more commonplace, further optimizing resource utilization.

DEPARTMENT OF ELECTRONICS AND TELECOMMUNICATION ENGINEERING

7.1.2 Energy conservation initiative 2022-23

Students of Second Year of Electronics and Telecommunication Engineering has implemented a room automation project in the view of conserving energy.

The project titled “**IoT Based Automatic room control using Arduino**” has been completed and successfully installed in Software and Research Lab.

Objective of project:

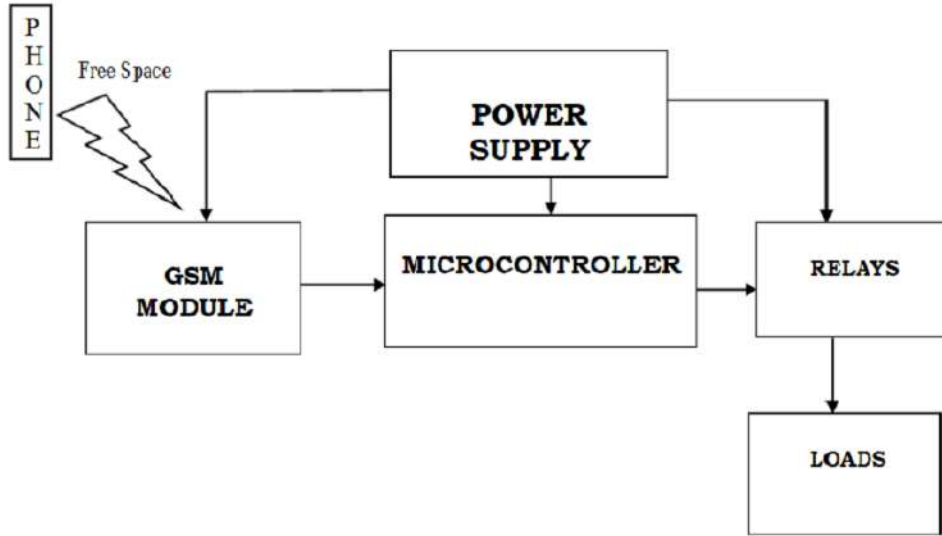

To control the connected electrical appliances remotely to reduce energy wastage.

Introduction:

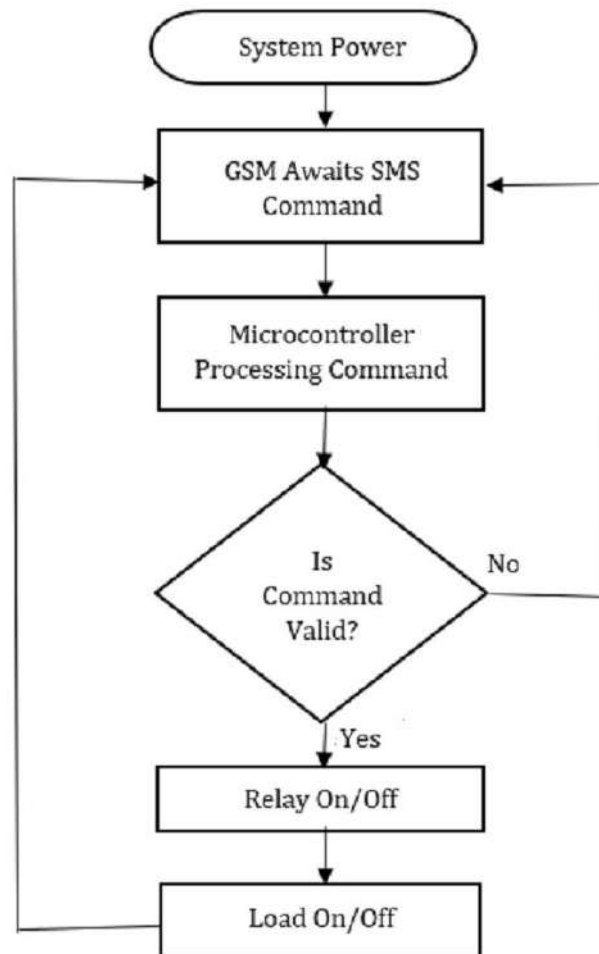

With the use of mobile phone, automatic room control system is used to control electrical appliances remotely (from any part of the world). Consequently, greater amount of energy will be saved and hence the natural resources. This system is designed using Relays, Arduino and GSM module. The electrical appliances are controlled by sending a text message from any mobile located in any part provided it has a GSM connectivity.

Working:

A message is sent from user's mobile phone to the GSM module enable with sim, the message is the communicated with arduino. The controller i.e. arduino compares the message received from GSM module with the stored messages in arduino memory. If the message is valid microcontroller takes action accordingly. According to the message received function programed i.e. ON or OFF of the relay that are connected to arduino is executed. Thus the load i.e. light, fans etc. connected to the relay are turned ON or OFF remotely and thus save energy if appliances are not needed.

ENVIRONMENT AND ENERGY USAGE POLICY

JSPM's Bhivarabai Sawant Institute of Technology and Research, Pune is one of the Premier Institutions in providing quality education for engineering students and it aims to produce professionals of technically competent and socially responsible. The institute has formulated the policy on environmental and energy usage to affirm the Institution's commitment to environmental and energy issues and to solve those issues through continuous improvement in environment-related activities. The policy aims to ensure environmental and energy compliance by adhering the sound environment and energy policies in the academic and administration departments of the institution.

The institute understands that ecological sustainability is the key component of social responsibility and therefore strives to conserve the environment by adhering eco-friendly approach. This includes conserving raw materials, energy, water and waste management.

The environment and energy policy connects all the sectors of the institution and it applies to all its stakeholders and the various activities carried out by the institution. It will help us to improve efficiency and environmental awareness in our everyday activities, thus helping us to realize our responsibilities and commitment to the conservation of natural resources and to limit their usage.

The policy is to conserve the natural environment, provide sustainable solutions and control energy consumption in order

- To create awareness among students about conserving natural resources and the development of a sustainable environment for national prosperity.
- To adopt an ethical and environment-friendly approach in all the activities of the institution to conserve the natural environment.
- To evolve futuristic technologies and develop engineering solutions that help us to sustain the environment and energy in an optimum way.
- To build a society that has an attitude of conservation and harmony with nature.

POLICY DOCUMENT ON ENVIRONMENT AND ENERGY USAGE

Extension and Outreach Activities under NSS and Departmental students associations sensitize the students towards environment sustainability through activities like cleanliness drives, tree plantations, speeches on environment and sustainability etc. Few audit courses are also offered to students which address the issues related to Environment and Energy usage and alternate sources of energy. Department of IT, Electrical and Electronics and Telecommunication Engineering have implemented student projects on renewable energy sources and energy conservation initiatives using latest technology in the departments.

On the campus in which the institute is located Sewage Treatment Plant is available which treats wastewater from various establishments on the campus. This treated water is used for gardening purposes to keep the campus green and clean. This helps in the conservation of clean water.

The campus is lush green with various types of plants and trees which produce lots of organic waste which is used after composting.

Solar energy systems are installed on rooftops which save a certain amount of energy. LED tubes/bulbs are used to conserve energy. Boards are displayed in classrooms and laboratories to switch off the lights, fans etc when not in use.

The policy document of the institute is aimed

- To assess our energy usage and measure its impact on the environment.
- To reduce local air pollution emissions using environment-friendly vehicles, including bicycles, public transportation and use of pedestrian-friendly roads.
- To maximize the natural ventilation for maximum conservation of energy.
- To install photovoltaic solar panels for the generation of alternate energy. To install LED bulbs in the complete campus to save energy.
- To develop a systematic waste management mechanism. To maintain the rainwater harvesting unit.
- To undertake a tree plantation drive.
- To use technological advancement to improve our energy consumption.
- To educate our faculty members and students on environmental knowledge and skills to improve our environmental performance.
- To provide information and training opportunities on energy-saving measures.
- To offer opportunities for faculty members and students to engage in initiatives that contribute to environmental protection.
- To train our faculty members and students and make them 'Go Green Specialists' and partners to plant trees each year.
- To take up environment, energy and green audit every year.
- To review the activities related to measures and initiatives taken for environment sustainability and energy usage.
